

Commentary

I found this project quite interesting, since it helped me realise the project lifecycle better. I learned about DNA sequences, exons and codons. We helped each other throughout the whole project and learned from each others' mistakes.

We came across a lot of challenges especially time wise since we all have booked holidays.

I, particularly, learned to use github and the command line in the terminal which I wasn't used to at all.

The only thing that we could have done differently is to spend more time figuring out how the actual webpage should look like. we spend so much time trying to get the results back that we didn't have much time left for the css of the webpage.
